

Infrared Thermography Scanning

Professional Consultants PROCON provides specialized technical consulting for concrete, coatings, ceramic tile, stone design and construction.

PROCON maintains sophisticated equipment and has specialized knowledge for conducting and analyzing infrared scanning thermography testing.

Thermoscan reveals heat loss and air exfiltration around the structural frame and through the building envelope resulting from failure to properly install insulation and / or water infiltration

Infrared thermography scanning offers a fast, accurate and cost effective means of diagnosing a wide range of problems in building envelopes and construction assemblies. This non-destructive method enables test results to be displayed in color thermal images. Infrared scanning can be used for detection of heat loss, air and water infiltration in building facades and roofs, as well as detection of subsurface voids, cracks and delamination of construction assemblies.
